

# Abstract

[The invention relates to a] A heel lining for [the] a shoe  
5 [industry], in which the material is a nonwoven fabric impregnated  
with a polymer, with a surface weight of 180 to 350 g/m<sup>2</sup>, and tear  
propagation resistance values > 15 N in both the lengthwise and  
the crosswise direction[, where the]. The nonwoven fabric is made  
up of melt-spun, aerodynamically stretched multi-component endless  
10 filaments, with a titer < 2 dtex, immediately deposited to form a  
nonwoven layer[, and the]. The multi-component endless filaments,  
after preliminary bonding, are split by at least 90% to produce  
supermicro endless filaments with a titer < 0.2 dtex, and are  
bonded.
